Design Feedback that Stimulates Children’s Creative Thinking
A Feedback Intervention

Alice Schut, Maarten Van Mechelen, Remke Klapwijk, Mathieu Gielen and Marc J. de Vries

Designing is an inherently creative process in which divergent (generative) and convergent (evaluative) thinking drive the creation and development of a design. Nevertheless, navigating these creative thinking processes is not an easy endeavour, especially for young novice designers. In Design & Technology education, design feedback is often seen as an essential pedagogical tool to help guide novice designers’ divergent and convergent paths while designing. Although design feedback can help the creative design process greatly, this does not happen by default. This paper reports on the construction and utilization of a design feedback intervention during a real-life design project with two groups of primary school children (aged 7-12). The goal of the intervention was to stimulate the young novice designers’ creative thinking by guiding the design feedback dialogues with their peers and clients. It guides convergent and divergent design feedback to minimize the resistance towards the feedback and creates openness for new processes of reflection, evaluation, and generation. Our main contribution entails a detailed understanding of the successes and obstacles within the feedback dialogues, as guided by the new feedback intervention, and possible future improvements. Overall, the results show that the intervention can support young novice designers, their peers, and clients in engaging in constructive feedback dialogues, thereby stimulating their creative thinking.

Keywords: Design feedback, Divergent Thinking, Convergent Thinking, Design Fixation, Creative Thinking

Introduction
Designing is undoubtedly a creative activity (Barlex, 2007; Goldschmidt, 2014; Howard, Culley, & Dekoninck, 2007). When designing, children are confronted with ill-structured open-ended problems (Dorst, 2003; Lewis, 2005), for which no formula or single ‘right’ answer exists. Consequently, they are required to resort to creative thinking processes (Dorst & Cross, 2001).

However, behaving creatively does not always come naturally to children (Luo, 2015; McLellan & Nicholl, 2009; Nicholl & McLellan, 2007). Creative thinking asks for a continuous shifting between divergent (generative) and convergent (evaluative) thinking processes (Goldschmidt, 2014, 2016; Guilford, 1967; Howard-Jones, 2002). Several different factors can easily stagnate this shifting. In the research project “Co-Design with Kids”, we have observed these instances of stagnation first-hand during one of the case-studies with a group of primary school children. There, the instances of stagnation became visible through the responses of the children design teams during the design feedback dialogues with their peers and the clients (Schut, Klapwijk, Gielen, van Doorn, & de Vries, 2019a; Schut, Klapwijk, Gielen, & De Vries, 2019b).

In this paper, we report on the construction and use of a feedback intervention meant to stimulate constructive feedback dialogues between design teams of primary school children, their peers, and the clients while participating in a real-life design project.
Literature review

Feedback in design education

Feedback interventions are a common educational practice within the context of design disciplines at a university level and are known as design critiques (crits) or design reviews (Anthony, 1991; Dannels & Martin, 2008; Healy, 2016). During these critiquing moments, students get the opportunity to update their instructors, peers, and other stakeholders - such as real or simulated clients and potential users - on their process and the status of their design and collect feedback (Dannels & Martin, 2008; Oh, Ishizaki, Gross, & Yi-Luen Do, 2013). The feedback dialogues are often centred around improving and developing a design and can directly impact the divergent or convergent paths a novice designer might take (Cardoso, Eris, Badke-schaub, & Aurisicchio, 2014; Oh et al., 2013; Yilmaz & Daly, 2016).

Resistance towards design feedback

Design feedback is generally assumed to be beneficial to the creative design process (Crilly, 2015). However, the results of our previous case-studies show that children's creative thinking is not necessarily stimulated or enhanced by the feedback conversations. Instead, the children showed resistance towards the feedback and a lack of evaluative and generative thinking processes (Schut et al., 2019a). Multiple studies have observed similar results at a university level (ea. see Cardella, Buzzanell, Cummings, Tolbert, & Zoltowski, 2014; Cardoso et al., 2014; Cummings, Tolbert, Zoltowski, Cardella, & Buzzanell, 2015; Daly & Yilmaz, 2015; Yilmaz & Daly, 2014, 2016). Since we observed problems with receiving and constructing design feedback, we believe that guiding these processes can create new opportunities to stimulate and enhance the children's creative thinking while designing.

Stimulating convergent and divergent thoughts

Studies by Eris (2004) and Cardoso et al. (2016) utilizing Eris’ Question Driven Design Model showcase that high-level questioning can facilitate moments of critical reflection and evaluation within design teams of university students, which helps them realize previously unthought-of obstacles or concepts (Eris, 2004) and makes them consider alternatives to their current design trajectory (Cardoso et al., 2016). Additionally, the results of both studies show that although high-level convergent feedback can facilitate moments of reflection and evaluation, the combination with high-level divergent feedback is needed to move the creative design process forward (Cardoso et al., 2016; Eris, 2004). However, before posing high-level feedback, a shared understanding of the design needs to be reached (Schut et al., 2019b; Stables et al., 2016). Therefore, questions that ask for verification and clarification still appear to be a critical first step.

In conclusion, in order for design feedback to be effective in stimulating young novice designers’ creative thinking it needs to: (1) guide towards a shared understanding of the design through low-level convergent feedback, (2) stimulate critical reflection and evaluation of the design to help identify and internalize possible shortcomings through high-level convergent feedback, and (3) provide a way to move forward by guiding new generative thoughts through high-level divergent feedback. These conclusions will form the primary guidelines for the construction of the new design feedback intervention.

We are interested in the influence of the design feedback intervention on the divergent and convergent nature of the design feedback and the concurrent creative thinking processes of the young novice designers. This led to the following research questions: What influence does the (peer)feedback intervention have on the convergent and divergent nature of the design feedback given by the client(s) and peers and the concurrent direct responses of the design teams?
**Research design**

To answer the RQ, we utilized a design-based research approach, comprising a series of two case-studies over one year (Bakker, 2018; Van den Akker, Gravemeijer, McKenney, & Nieveen, 2006; Yin, 2014). During these case-studies, two groups of primary school children (ages 7-12) from two different schools were guided to design solutions for real-life design challenges. From each school, one classroom of children participated in the study. Table 1 gives an overview of the two case studies, which we will now name case A and case B.

**Design Sessions**

During the two case studies, the design teams worked in their regular classroom on solving real-life design challenges presented to them by real clients. They were guided through the entire design project in six design sessions facilitated by the first and second author. The design activities were based on tools and methods from the CPS tradition (Isaksen, Dorval, & Treffinger, 2010; Tassoul, 2009), design tools from the Delft Design Guide (Boeijen van, Daalhuizen, Zijlstra, & Schoor van der, 2013) and lessons learned from previous research conducted by the authors. These lessons learned included, but are not limited to, the following topics: design fixation (Schut et al., 2019a), design feedback (Schut et al., 2019b), group dynamics (Van Mechelen, Zaman, Laenen, & Vanden Abeele, 2015), co-design processes (Van Mechelen, 2016; Van Mechelen, Laenen, Zaman, Willems, & Abeele, 2019), and children’s design skills (Van Mechelen, Schut, Gielen, & Klapwijk, 2018; Van Mechelen, Schut, Gielen, & Södergren, 2019). Table 2 gives a concise overview of the content of each of the design sessions. Furthermore, the tools used in the design sessions can be found on the following websites: www.tudelft.nl/codesignkids (English version) and www.tudelft.nl/yourturn (Dutch version).

Design Feedback intervention

Overall, the goal of the feedback intervention was to support a constructive feedback dialogue that would stimulate the design teams’ creative thinking and help prevent and/or overcome resistance. Since the focus of this study is on the feedback dialogues, the focus will lie on the implementation of the feedback intervention during the 4th and 6th design sessions. In those sessions, a design critique took place, during which the design teams took turns to present their design and receive feedback from their peers (the other design teams) and the clients. A feedback form was utilized during the 4th design session as a scaffolding tool to help the peers and clients with the construction of their design feedback. During the 6th design session, the facilitators utilized verbal prompts to remind the peers and clients of the structure of the feedback form. Table 3 gives a concise overview of the procedure.

### Data collection

During both case-studies, all design sessions were audio and video recorded as different researchers covered different research angles as part of the overarching research project. Due to the focus of the current study on the verbal feedback interactions, only the recordings of the 4th and 6th design sessions were selected for data analysis.

### Data analysis

To analyse the data, we followed the Verbal Analysis approach (Chi, 1997). The transcriptions of the audio-video recordings of the interactions of the selected design teams during 4th and 6th design sessions during cases A and B were used as the primary data source.

#### Units of analysis: Design feedback & direct responses:

Units of analysis were created of consecutive feedback and direct responses based on the conversation content. Within the units, pairs of feedback and response were formed.

#### Coding frameworks

To determine the nature of the feedback of the clients and the peers, Schut’s Design Feedback Model was used, which is displayed in figure 1 (Schut et al., 2019). To determine the different types of direct responses of the design teams Schut’s Direct Responses Model was used, which is displayed in figure 2 (Schut et al., 2019). When instances of feedback could not be coded with the models, additional codes were formed through inductive coding and added.
Figure 1. Design Feedback Model, based on Schut et al., (2019). The responses highlighted in grey emerged in the current study.

Figure 2. Direct Responses Model based on Schut et al., (2019). The responses highlighted in grey emerged in the current study.
Coding process

All of the created pairs were coded with feedback and direct response codes from the models. Additionally, we classified who posed the feedback to the design teams: the client(s) or their peers. To analyse coded data, tables were constructed with the code occurrences and code co-occurrences of cases A and B. These tables, together with the coded transcripts, were used as a means to interpret the data and look for patterns.

Findings

The following sections introduce the results of the qualitative analyses. Translated excerpts of the transcripts of the feedback dialogues are given to illustrate the results.

Fourth Design Session: Feedback Procedure ‘Part 1’

Clarifying the design through low-level convergent feedback

During each feedback round of a design team, the first part of the feedback procedure is meant to guide towards a shared understanding of the design. As intended, the majority of the direct responses (DF) posed in both cases consisted of low-level convergent questions. With these questions, the clients and peers predominantly checked their understanding of the design through verification questions; and asked for additional information about the design through feature specification and concept completion questions. The DR of the design teams to these low-level questions in both cases consisted mainly of report.

Peer: So, you have to solve a math problem and the answer... Uhm... What did you have to do with the answer again? [Concept completion]

Child: The answer, that number is how often you have to score (in the goal). [Report]

Besides report type responses, the low-level convergent questions in case A were also met with the DR confirm. This difference can be attributed to the higher occurrence of verification questions in this case.

Peer: So, you have to run as fast as you can to the right spot (on the playground)? [Verification]

Child: Yes. [Confirm]

The majority of the DRs during the first part could be considered as responses that enable a constructive feedback dialogue. However, there were also a few resistance responses present in both cases.

Fourth Design Session: Feedback Procedure ‘Part 2 & 3’

The second part of each feedback round corresponds with the 2nd and 3rd part of the feedback procedure, during which the constructed high-level convergent and divergent feedback with the guidance of a feedback form. The DF of the clients and peers in both cases was generally in accordance with the structure of the feedback form. Almost all of the DRQs consisted of future description, which is one of the new feedback codes added to the model during analysis. As intended, almost all of the GDQs on the feedback forms consisted of method generation and proposal/negotiation. In both cases, the feedback forms read out-load by the clients and peers primarily co-occurred with the DR.

Sixth Design Session: Feedback Procedure ‘Part 1, 2 & 3’

In this design session, only verbal prompts were used to guide the dialogues and all of the feedback parts (1,2 and 3) follow each other directly during each feedback conversation.

The peers’ focus on convergence

Similar to the results of the 4th session, the peers utilized this first part of the feedback procedure to check their understanding of the design. However, the peers did not adhere to the order of the feedback form when posing high-level feedback in this session. Instead mainly convergent feedback was posed, with only a few instances of divergent feedback. The high-level convergent feedback (DRQs) of the
peers was varied in case A, while in case B the majority consisted of future and future description. In both cases, around half of the DRs consisted of report type responses, of which around half was report justify. Besides this, the DRQs of the peers were also met with resistance responses, especially band-aids and question not relevant. These responses imply that the design teams were not as open to the DRQs posed by the peers as to the DRQs by the clients.

Peer: Why does someone have to pull on the cable and is it not electric? [Expectational]
Child: We didn’t think an electric cable was needed. [Question not relevant]

Opposite to this, there were a few instances of deep reasoning responses, as illustrated in the example below. However, these types of DRs predominately occurred when a design team already displayed a certain level of openness in the feedback dialogue preceding the DRQs.

Peer: Imagine that the answer (to the math problem) is 64. You said that the side poles (of the goal) are 50 (points), and the top bar is a 100 (points). But there is not exactly 64 on any of them. [Future description]
Child 1: Well, you also have pons, and there are also numbers on there. [Report]
Child 2: Oh, yeah. Those (the pons) are not an uneven number. [Reflection]

The key to openness: verification & compliments

Compared to the DRs towards the DF of the peers, the DF of the clients was met with more openness from the design teams. Below is an example of such a constructive feedback dialogue between one of the clients and a design team. The design that is discussed was rather unusual and received some critical feedback from the peers at an earlier point in the feedback dialogue. The team reacted to this DF of their peers with several resistance responses, trying to prove the quality of their design. However, the manner in which the team reacts to the DF of the client is very different.

Client: So the idea is that you will build an ice-rank? [Verification]
Child 1: Yes, I guess so. [Confirm] [Insecure]
Client: And this means that the ice-rank is there all year round? [Verification]
Child 1: Yes. [Confirm]
Child 2: It depends on if you want to ice-skate in the summer. [Reflection]
(…)
Client: So the ice-ring will be there permanently? [Verification]
Child 1: Yes. [Confirm]
Client: And what else could you maybe do with the ice-ring? [Ideation] If it’s a hot summer, will there then also be ice on it? [Feature specification]
Child 1: Maybe you can then also use it as a pool. [Ideation]

The example illustrates how the client first puts their effort towards gaining a shared understanding of the aspect of the design they want to direct their high-level feedback to. After, the client proceeds to pose their high-level feedback, which then evokes a concurrent convergent or divergent response from the design team.

Discussion and conclusion

The results of the current study demonstrate how different types of guidance supports young novice designers, their peers, and clients in engaging in constructive feedback dialogues. Several successes were uncovered during the analysis, showing how the intervention was able to (1) guide towards a shared understanding about the design, (2) stimulate cognitive modelling, (3) encourage an initial calmness towards high-level feedback, and (4) evoke deep reasoning responses.
1. The intervention aimed at establishing a shared understanding of the developed design at the start of a design feedback dialogue through low-level convergent feedback. In general, this led to a constructive start of the feedback dialogues. Several studies confirm the importance of clear communication and a shared understanding about the design between all parties for a feedback dialogue to become valuable (Sadler, 2010; Schut et al., 2019b; Stables et al., 2016).

2. The repeated occurrence of the high-level convergent feedback types future and future description, especially from peers, showcase the peers’ ability to construct mental models of the design mechanics and user interactions. This ability of cognitive modelling is argued to be the core of designerly thinking and fundamental to one’s creative abilities (Baynes, 2010).

3. The primary direct response of the design teams to the reading out-loud of the feedback forms by their peers and the clients was silence, which shows a level of calmness. Although this does not directly give a clear insight into their thinking processes, a positive impact of the intervention is clear when we compare it to the feedback sessions in an unguided session, where high-level feedback was often met with resistance (Schut et al., 2019b; Schut et al., 2019a).

4. Through these reflective, evaluative, and generative responses, the teams showcased their willingness to further elaborate on and improve their design. These responses were often preceded by feedback of the clients of case B during the sixth design session. With more freedom in constructing their high-level feedback, the clients deviated from the format of the feedback form, while still utilizing the core principles of the design feedback intervention. Firstly, the clients repeatedly checked the shared understanding of the designs. Secondly, the clients almost solely constructed high-level divergent feedback, while only a few instances of high-level convergent feedback were observed. Divergent feedback plays a crucial role in helping the receiver of the feedback ‘move forward’ (Black & Wiliam, 1998; Hattie & Timperley, 2007) and stimulating their creative thinking (Daly & Yilmaz, 2015; Tolbert & Daly, 2013; Yilmaz & Daly, 2016). Lastly, another possible contributor to this open atmosphere is the many compliments the clients shared when compared to their peers. Although the opinions on praise as an effective form of feedback for learners appear to vary (Hattie & Timperley, 2007; Voerman, Korthagen, Meijer, & Simons, 2014), our results show that in the context of design feedback dialogues it could encourage more openness with young novice designers.

To conclude, the results have shown that the (peer) feedback intervention is able to help direct the divergent and convergent nature of the feedback posed. The presented successes showcase how this directive ability positively influenced the children’s initial responses towards the feedback, which makes a compelling case for why design feedback should be guided.

**Future work**

We will expand the current results by analysing additional data to uncover how the design teams selected, discussed, and utilized the feedback while elaborating and adjusting their design. Together, these studies will give an in-depth view of the influence design feedback can have on young novice designers’ creative thinking.
